

# Machine Screw Anchor Installation Tools

**\*\*\* NEW FROM ELCO \*\*\***

- The fastest, easiest and most reliable way to install machine screw anchors (caulk ins)
- No use of the clumsy hammer & setting tool or the expensive and slow expander setting tools
- Power tool does all the work
- Put RapidSet® Installation Tool into power tool, trigger tool to rapidly spin anchor onto tool, insert into hole and trigger tool. (Battery impact drivers work great)
- Eliminates the need for anchor to be bottom bearing
- Automatically sets anchor just below the surface – no guessing on depth
- MAXX model (1/4-20 size only) allows for placing anchor at various depths (up to 2") below the surface as in stucco over block applications
- Mechanical action of tool's threaded stud pulling up on internal anchor threads is much more efficient than pounding down the lead anchor sleeve.
- Maximizes expansion of bottom portion of lead sleeve which results in consistently high pull-out values
- MAXX version actually pulls down from the top in addition to pulling up from bottom for even higher pull-out values

## **RapidSet®**
